## Default Modifier

## Private Modifier

## Protected Modifier

The image displays two screenshots of the NetBeans IDE 8.0.2 interface, illustrating the use of the Protected modifier in Java.

**Top Screenshot:** The main editor window shows the `ProtectedModifier.java` file. The code defines a package `package1;` and a class `ProtectedModifier` with two methods: `protected void printInfo()` and `protected void sendMessage()`. The `printInfo()` method prints "Protected Modifier" and the `sendMessage()` method prints "this is a message". The `Debugger Console` shows the output of the `run()` command: "Protected Modifier" and "this is a message".

**Bottom Screenshot:** The main editor window shows the `DemoProtected.java` file. The code defines a package `package1;` and a class `DemoProtected` with a `main` method. The `main` method creates an instance of `ProtectedModifier` and calls its `printInfo()` and `sendMessage()` methods. The `Debugger Console` shows the output of the `run()` command: "Protected Modifier" and "this is a message".

## Public Modifier
